

A 4G connectivity pack which enables a reliable and secure internet connection to Priva building management systems is now available in the UK.

This latest launch from [building automation company](#) Priva, will be welcomed by users who struggle to manage building services on sites where there is no internet connection. With the Priva Connectivity Pack 4G, connection to a BMS can be established quickly and simply. The inclusion of two external antennas ensures optimum signal reception and data transfer speed.

The pack is completely 'plug and play' and is supplied with a router and an activated SIM card so that it works straight out of the box. It is designed to connect automatically to the most suitable network (EU roaming automatically establishes a connection to the most suitable network in range). Just like Priva's other online applications, the 4G Pack is updated automatically.

The hardware supplied with the pack – which includes a router with DIN rail mounting clip; an ethernet cable; a power supply adaptor and two antennas; plus the activated SIM card - is durable and rugged to ensure maximum reliability. If, for any reason any part of the pack fails, Priva will send a replacement

component free of charge.

The Priva Connectivity Pack is available to Priva's network of Partners and end-user customers on an annual subscription; users simply pay a fixed amount per month for the 4GB data bundle. The price is based on fair use - which means there is no issue for those who occasionally exceed the data limit.
