

## BUILDING MANAGEMENT

- > **Efficient input of installations**
- > **Constant insight into the performances of your entire building**
- > **Constant desired indoor climate, on an individual basis or per area**

Whether you are looking for solutions for an office building, school, hospital or museum, you want an ideal climate for your building users. At the same time, you naturally want to deploy your installations as efficiently as possible, without wasting energy and money.

This is why we offer our solutions to you via a graphic interface so that you have insight into the performances whenever and wherever you may be, so that you can constantly optimize them. You set the desired or required climate for each space, or set them individually. At any time of day that suits you.

By integrating information about issues such as burglar alarms and fire detection, for example, you are not only monitoring the indoor climate in the same area. You also view the status of your other systems and automatically receive warnings of any faults or notifications about parts that need replacing. In short: insight into the performances of your entire building via a web-based application.

## Management

Our building management systems offer you far-reaching control over the tasks and moments your installation needs to perform. In this way, you can integrate holiday days into the system, for example, to make automatic adjustments on those days to settings for specific areas. Do you wish to temporarily adjust the switching time for light and the temperature from 6.00 to 6.30? No problem. It merely requires a few simple clicks. Are there complaints about light or the temperature, or do you have a problem with a draft? You simply need to consult your installation, analyze the situation, and make the necessary corrections.

## Service

With our service solutions, you ensure that any faults, deviations, maintenance and alerts are relayed directly to the technical service, your service provider or installer. The intelligent system collects all the reports and sends an email or SMS to the email address or telephone number provided. Because the information is conveyed directly to the right person, you are sure that your installation always remains in top condition. It ensures that you save time and money and always have a clear insight into the status of your installations.

## Integration of information

Through the integration of information about issues such as burglar alarms and fire detection, for example, you are not only monitoring the indoor climate in the same area. You also view the status of your other systems and automatically receive alerts about faults or notifications about parts that need replacing. All via a single web-based dashboard that gives you an insight into the performances of your entire building at any time and any place.
